

The way home affairs is set up in my country South Africa, at the moment, it is easy to say it needs fixing. let's start with taxation? every year people are expected to stand in a line to pay their taxes, or they get penalized by about a thousand dollars of ten thousand rand.

The best way to deal with this is to put it to the banks all year long. i mean, it is orderly to have it done all at once, and it could be more neat and tidy, but having it done over three months, when you could have it done in three weeks, is ludicrous!

So, the best thing to do if you ask me, is to make it so that the banks just deduct the taxes each month. this would shift the balance from the state onto the banks, who do it without the people coming in, and, they could even write a program that goes into the files to find totals quite easily. then, the auditors could write a audit worm that randomly goes through the bank accounts each day, and gives inconsistencies via email to the bankers and state team. then, at financial year end they could compare it to last years totals and such.

If we need to sort out home affairs without spending too much money, we could just simplify things! if things were simple like in my previous suggestion, it would be easier to navigate and organize. i remember going to get a passport once, and it was nearly chaos.

The ticket system works. the amount of people coming in, well, that can't be helped, unless there are more home affairs buildings. if they were to take old run down homes, or, even open plots in the suburbs, then there would be less congestion. well, this will be quite cheap, about five hundred thousand rands per suburb, taking, on the average of say a ten thousand people per suburb, fifty rand each. i think that is a good ratio?

Them we got to hook them up! i suggest that all files are not

shared on a server, and, instead, they get emailed to each other automatically if they are in the right drive. of course, they should be color coded so as to get the most speed out of them, and, i suggest a privately made program to avoid hackers. it would take about a day to write this program too, costing about 20 000 rand or 2 000 dollars.

Also, regarding the state of the salaries of those that work there, they should get eighteen percent each year, to keep them interested.

A while ago, i suggested to stop drunken driving they should take the keys away from people until they sober up. that is not very realistic is it?

So, now i suggest that they carry a sober up drink with them. this drink will come free at the end of the drinking session, and it must be cheap, yes? i suggest a bit of 'lert' stimulants to combat the drowsiness of the driver, or even keeping poppers in the car. actually keeping them for free like peanuts could work out well.

To stop domestic violence last week i wrote about how talking to your parents and husbands could help - if you talk tot hem while they are stressed at work, they will feel like someone cares.

Now, to stop all violence, well, the way i see it, violence is related to stress of some sort, or tension. it is not like somebody just walks up to someone else and hits them. well, in the ghetto, this is true, because of stress. this stress is usually financial, yes? but we cannot give everybody money, so;

If we were to give them too much to eat, then they would be too full to be violent. but that also requires money.

So, if we were to increase 'sexual exploits' like male masturbation, there would be less stress. bombing these areas with porn would do the trick, yes?

Or, if we were to issue every shop owner with a baton and a license to arrest people, then there would be less violence too. pressing criminal charges to make them be aware of what is going on, and participate, seeing as how it is near them and it is their moral obligation as a citizen would do.

Then, we could also try to view the violence as a cost to the state. if it were that there are medical bills to pay for, and legal bills too, then there would be financial gain in making their own country less violent. they might also observe that most violence is resource related, so there is the issue of insurance too.

So, they should maybe as soon as they feel threatened, make conversation, and offer them a handshake? this will relieve all the stress, as the assaulter might think they have gained this person's respect, yes? to add to this, the victim could talk their way out of a mugging, so, that they do not lose their health too!

Now if they were to open a dialogue, they could say they are a policeman or something important - how will the others know? this might deter them even more, but it is likely to avoid the violence, which was the purpose of this entry.

List of unsolved problems - Chirality.

This is where something is distinguishable from it's mirror image. the first step is to see that it is in a different area, making chiral or whatever.

It could also be distinguishable if it was alike, but, nothing is alike! therefore there is no such thing as a mirror image - if you go small enough, the, say, orbitals, will be in a different place, yes?

Okay, then how about the fact that, trying to tell them apart, there will be two s1 orbitals, and we can tell that they are in different places?

Why are accelerated kinetics observed for some [organic reactions at the water-organic interface](#)?

This is where the solubility or 'suck up ness' of the organic material actually invites the water in so it can fuel it - it is busy 'combusting' as fuel before it gets into the organic materials by the organic materials - it is so hungry that the smell of the food satisfies it!

What is the origin of the [energy barrier to bond rotation](#) (e.g., in [ethane](#)), simple [steric hindrance](#), [hyperconjugation](#), or another explanation?

The energy barrier to bond rotation is started by heat and energy of some sort, and, this begins the same way the universe began - with motion, i presume. the motion comes from the different particles being in the same space - friction of different materials, or, energy through polarization.

This makes me think of the beginning of the universe, as, there was suddenly two of something, then they pushed or pulled, leading to motion, which is energy, and energy is never destroyed, it just changes forms into something else, being the third thing, then another thing, then another two things, another two things, adding half or less than half each time it 'moves.'

Of course, the initial thing was some energy, there is either no energy or some energy. think of a seed of moss, then there is more moss, and more, and so forth?

What is the origin of the [alpha effect](#), that is, that nucleophiles with an electronegative atom with lone pairs adjacent to the nucleophilic center are particularly reactive?

This is because they are in between a lot of electrons, all moving, and, they will be getting the conductivity from them into the center where they all want to be. this is like a knock on effect, or, like if you were to have an oscillator - you would have something

that should be moving if there are five, but, only two really move. the center one will be charged twice as much, as, there it links the energy from both directions.

If there is mass, it will accelerate to more mass, as, it will be based on quarks, as, there is no mass outside the potential energy of positive charge. so, kinetic energy is negative! [okay, fact learned there by myself.]

So, with the like energy repelling each other, there must be some mistake! as, if positive energy should repel negative energy. this means, of course, all magic is negative energy! [another point learned by myself!]

Now, if the greater mass has greater potential energy than the lesser mass, it will attract it as it is also negative. but, when you place two stones together, then you will see mass does not bond, it displaces. this means, of course, that mass tries to displace other mass, as, it has negative and positive energy just like the other mass. this is why it is displaced!

If the mass is attracted to each other, then, there needs to be some 'force.' all force comes down to negative energy, and, therefore, it is a suck force between electron masses that makes them 'sparkle' together - if you had two wires, they are both positive, add electricity which is negative, and they seem to be out of control. make the electricity just close enough to be not really reaching, and they try to reach! if you had a magnet that is emitting positive charge, like a south or north, and another, you will see that like repels as there is no charge, but, you can place them both on each side of a piece of metal, yes?

*What is the nature of strong gold-chalcogens in thiols and other organochalcogens (i.e., sulfur and higher **chalcogen**-containing **organic compounds**)?*

Well, six air atoms, to two carbon atoms for the R is easy to work out! if it was air and matter, it would be steam or soot, or, fire or heated carbon, or, like a balloon, yes?

☞ Originally Posted by <http://en.wikipedia.org/wiki/Chalcogen>

The **chalcogens** (***/ˈkælkədʒɪnz/***) are the **chemical elements in group 16 of the periodic table**. This group is also known as the oxygen family. It consists of the elements **oxygen**(O), **sulfur** (S), **selenium** (Se), **tellurium** (Te), and the **radioactive element polonium**(Po). The **synthetic element livermorium** (Lv) is predicted to be a chalcogen as well.^[1] Often, oxygen is treated separately from the other chalcogens, sometimes even excluded from the scope of the term "chalcogen" altogether, due to its very different chemical behavior from sulfur, selenium, tellurium, and polonium. The word "chalcogen" is derived from a combination of the Greek word *khalkós* (χαλκός) principally meaning **copper** (the term was also used for **bronze/brass**, any metal in the poetic sense, **ore** or **coin**),^[2] and the Latinised Greek word *genēs*, meaning **born or produced**

This is there to give a bit of poison to the system to kill off other things, like blood cells, maybe? or, it could be there to stimulate or form acids, yes?

What are the electronic structures of high temperature **superconductors** at various points on their **phase diagrams**?

☞ Originally Posted by http://en.wikipedia.org/wiki/Phase_diagram

Common components of a phase diagram are lines of equilibrium or phase boundaries, which refer to lines that mark conditions under which multiple phases can coexist at equilibrium. Phase transitions occur along lines of equilibrium. **Triple points** are points on phase diagrams where lines of equilibrium intersect. Triple points mark conditions at which three different phases can coexist. For example, the water phase diagram has a triple point corresponding to the single temperature and pressure at which

solid, liquid, and gaseous water can coexist in a stable equilibrium.

*The **solidus** is the temperature below which the substance is stable in the solid state. The **liquidus** is the temperature above which the substance is stable in a liquid state. There may be a gap between the solidus and liquidus; within the gap, the substance consists of a mixture of crystals and liquid (like a "slurry").*

We are all familiar with conductors, now super conductors;

 Originally Posted by **google**

Superconductivity is a phenomenon of exactly zero electrical resistance and expulsion of magnetic fields occurring in certain materials when cooled below a characteristic critical temperature. It was discovered by Dutch physicist Heike Kamerlingh Onnes on April 8, 1911 in Leiden.

This will be where there is less mass, so air, that carries electrons, so as to be unstable and stable at the right duality. if the positive and negative are exactly stable, there is no annihilation, as all the quarks are taken up by the rest of the particles. this means that there is being injected into it, more negativity than positive energy, altering it to be electronegative, yes?

So, if there is complete stability within this, there will be a charge of electrons consuming the matter, but, the matter will hold. this means, of course, that a wire could hold a lot more than it does normally, but not so much so that it ignites or melts. of course, even wood, a non conductor, will catch fire with enough electricity going into it, yes?

Now, if the thing is big, it will take more time to 'catch fire.' this is because there is more quarks than electrons or electricity until there is more of them. you can have as much electricity going through as you have mass, at a level similar to the particle scale, including of course orbital activity, minus proton activity.

I hear i might have to ride a motorcycle soon, so figured it would be great if i could regrow legs and stuff if i got injured. it would be horrible to go to hospital to get redone, so i figured i would stick this here.

Basically, the fuel you need to regrow your limbs is in the sugar you eat. there is also plenty of sugar! so, i figure it could be easy to become, for lack of a better archetype, wolverine!

So, for this you will have to grow muscle and bone. this can be done by flexing up to the point that you lost, as, the muscles will lead to newer muscles 'coming out,' or old muscles fully forming. then there is the factor of bones, so drink a lot of calcium too! the perfect thing therefore, is milkshakes, if you ask me.

Now, have i missed something? how long will it take? i need feedback to perform this thing!

If you were to observe that signals are also made of energy, then a cell phone might be able to let you know how the faeries around you feel about what you are doing.

So, if you were to randomly look at your signal bar, the higher it is the better it is for you, but, to be missing it out by one bar would mean that the faeries do not like it, two bars they would not like it more, and so forth. you are only looking for full bars to validate your thoughts.

I find this is because the energy of electromagnetism from around our solar system will alter the signal, depending on which planet you are confiding in, or which spirit or element.

I have found the secrets to magical animal tattoos, but not symbols. if you were to light a candle while you are getting a tattoo, and close your eyes, you will see colors and shapes as you normally would. these are faeries that are attracted to you,

so, you just got to imagine yourself 'absorbing' them.

If it is an armadillo, for example, you will become tougher, so, that people that hit you, or when a car knocks you, it will be as if the person put the brakes on at just the right time to make the damage less. if it is a swan or pea\$#@!, you will become more comely to those around you.

This is because your subconscious alters your movements and expressions, so, in the case of beauty, you will take on an expression you admire and now dare to flaunt. in the case of the armadillo, you will think you can dodge the car, or, as the monks do with their lying on nails, well, mind over matter, yes? the thing is, your mind will believe it is subconsciously over the matter, and it will be!

If you were to look into the light, you will be blinded, try it, look into the sun! this is because our eyes nerves are too sensitive to take in the full message from the 'planet' known as the sun, as, it's electromagnetism carries radiation, photons and all sorts of other things.

So, if you were to observe the light we see when we see 'illusions,' it is little bricks on walls acting as if they were emitting light, yes? these move in relays, like a chain carries current.

To activate them means taking power from our bodies and minds, and emitting it to these bricks or whatever we want to make an illusion on and then making it radiate - the electrons activate the photons with energy - the electrons make photons. they make them by charging the quarks, and then there is either electricity or heat of some kind, and, then there is activity, as, heat consumes quarks that are positive, then recycles them, as they do not annihilate by the negative spin. this means that the illusion may remain for a while. obviously, it is easier to use a lit candle to make these, as, they will already be 'heated.' it is down to eye's nerves to see these illusions, of course.

Now, if you were to create photons that are temporarily used up, then fizzle out when they reach a certain point, it means the quarks have recovered and 'stabilized.' then they swap around! the [x] goes to the [y] place, and the [y] goes to the [x] place. this means we will never not be able to make illusions if we can, of course, as there is unlimited fuel. the air's atoms can also be ignited, actually, more easily, as they are mainly oxygen and not mortar or whatever, yes?
